WITTMANN Named a "Best Buy" for Robots

Technology working for you.
The Innovative Robot Concept

Decades of application experience and innovative developments have made the WITTMANN robots what they are today – the best robots for the plastics industry! Well planned detailed solutions and state-of-the-art components allow highest reliability, shortest cycles and long intervals between maintenance.

**SmartBus Technology**
All sensors and actuators on the robot are directly wired to the intelligent control card under the robot hood. The connection to the control cabinet and the Teach Pendant is a simple Bus-cable.
- Total flexibility in the production of injection molded parts
- Single point programming through robot TeachBox
- Safe investment with ability to exchange peripheral system at any time.

**Kick Stroke Beam**
A large aluminum extrusion provides a stiff, vibration free foundation for the vertical arm. The reduced moveable mass allows high acceleration and deceleration for extremely short cycle times. The bearings for horizontal stroke and kick stroke are positioned in the main carriage next to each other to provide optimum stiffness and minimum vibration for high speed operation, allowing precise insertion and removal.

**Powerful Servo Drive**
Servo drives are used on all 3 main axes.

**Z-axis (horizontal stroke)**
All larger robots including the W821 model are driven in the Z-axis via rack and pinion with built in lubrication chamber for high speeds and long life operation. The rack and pinion drive guarantees precise positioning also with long strokes, avoiding the flexibility of long belts.

**Rugged Steel Beam**
Precision machined for perfect alignment of rails and rack.

**Reduced Maintenance**
As a standard the robots are equipped with linear bearings with lubrication chains. These are the latest technology bearings providing lubrication intervals up to one year! (Depending upon robot cycle and operating conditions).

**Additional Rotational Axes (optional)**
- A-axis wrists pneumatic 0–90° and/or 180°.
- B-axis motor driven 0–270° rotation for removal from fixed or alternatively movable platen side and for flexible placing of parts in different orientation. Programming through teach pendant.
- Servo A/B/C-Axes for up to six degrees of freedom.

**C-axis (standard)**
C-axis rotation for placing parts. Compact design for minimum mold opening. Pneumatically operated rack and pinion drive for high and constant torque during rotation.

**Integrated Control Cabinet**
Use of state-of-the-art compact servo modules integrated on the robot itself eliminates the need for an external control cabinet. The integrated control cabinet is mounted behind the horizontal axis for valuable space savings in the molding shop.

- Space saving
- Short motor and encoder cables
- Less cables and connections to fail
- Highest reliability of robot operation

The integrated control cabinet allows electrical connection of external I/O-modules via a bus cable for the direct control of all attached peripheral equipment.
The control offers the user a comfortable graphical user interface via the Touch Screen TeachBox for direct selection of all functions. To avoid unintended operation, the TeachBox can be unplugged from the sub-pendant which contains the main operating functions of the robot. Teach programs can either be saved via the integrated USB-port – on the memory stick provided – or on an integrated flash card memory.

**Advantages**
- Shortest training time for personnel.
- Free programming of every robot operation.
- Infinite diagnostic possibilities of the robot functions.
- Integrated observation of maintenance intervals.
- Different programming levels for the respective user profile.

**Total Flexibility**

The control system offers 2 levels of operator interface as standard. QuickEdit for the modification of a few select commands and, Text Editor for ultimate programming freedom.

This allows any arbitrary robot sequence to be programmed via simple, intuitive menu navigation. Neither editor needs command codes, the designated functions are executed directly at the robot and are transferred via one keystroke into the program. The naming of the peripheral inputs and outputs, cylinders, grippers, and vacuum cycles facilitates the readability and allows for a clearly arranged program structure.

**Additional Features of the CNC8 Control**

- Ethernet interface for the connection to a company wide intranet or internet.
- EcoMode: automatic optimization of axes velocities outside of the mold for smooth operation of the robot.
- SmartRemoval: shortest part removal time through acceleration of the vertical arm during mold open motion.
- Freely programmable safety areas: the user can define the areas of robot motion to avoid collisions with components of the IMM during manual mode.
- iVac: allows programming of limit values for the vacuum in order to provide part recognition in the end-of-arm-tooling.
W702 Sprue Picker

For the removal of sprues and parts from the injection molding machine. The solid construction allows fast movement with low vibration for precise removal.

- **X-axis (kick-stroke)**
  - Heavy-duty linear rails and recirculating ball bearings.
  - Swivel base to rotate the arm behind the fixed platen for mold changes and locating pin to precisely reposition arm for part removal.

- **Y-axis (vertical stroke) 0–550mm (21.7") or 700mm (27.6")**
  - Adjustable stroke.
  - Pneumatic shock absorbers.
  - Locking cylinder to prevent the arm from drifting down into the mold in the event of air pressure loss.
  - The Y-axis is also equipped with a heavy-duty switch as an additional interlock before the mold can close.
  - Energy chain for less wear of tubing.

- **Z-axis (pivot)**
  - Freely adjustable from 45°–95°.
  - Simple changeover from rear side to operator side placement.

- **B-axis (90° tooling rotation)**
  - Rotation is made automatically when pivoting the Z-axis out of the press.

**Mechanical Sprue Gripper**
with part monitoring.

**optional**
- Venturi vacuum with part monitoring.
- Parts gripper with 4 suction cups.

SA7 Control

- For W702 sprue picker.
- Easy to use interface with graphical LCD display. Arrangement of buttons and symbols is similar to the CNC TeachBox for easier use by the operators.
- Simple sequence start.
- Simple Teach-In programming of the entire program sequence, including all movements, strokes, time settings and molding machine interface.
- 4 standard programs for easy setup.
- Up to 50 additional individual programs can be taught and stored.
- Standard molding machine interface (SPI & E12).
- Full diagnostics with text error messages.
- Different languages are included and can be selected: English, German, French, Spanish, Chinese, etc.
The Innovative Series of Small Robots

The robot models as well as the W808, W818 and W818T are perfectly suited for smaller molding machines up to 200 tons clamping force.

This line of robots has a common fixed kick stroke design. The rugged, specially reinforced aluminum profile is attached directly to the main carriage so that nothing is sticking out towards the injection unit. Even on small molding machines there is no possibility of collision with the hopper.

The rugged lightweight vertical arm is guided by high capacity linear bearings to allow fast movement with minimum vibration, for precise insert and part removal applications.

W808 3-Axis High-Speed Series

The smallest model in the 3-axis servo robot line designed for mounting on molding machines up to 120 tons clamping force.

- Motorized servo drives on all 3 main axes.
- Compact construction of the vertical axis and the highly integrated wrist rotation allow handling of parts with the minimum amount of mold open space.
- High performance servo drives and high grade linear rails on all axes permit high velocities and the shortest part removal times.
- Many additional features of the entire robot series are available as options including: vacuum and gripper circuits and different I/O modules for the control of complex peripheral equipment.

W818 Universal Series

The optimum robot providing flexible automation for your current and future requirements on smaller molding machines.

- High performance robots featuring servo motor drives for all three main axes.
- Optional rotational axes allow additional flexibility.
- Extremely smooth operation with lowest noise.
- Minimum part removal times are essential for the highest productivity of the automation cell e.g. production of thin wall components. The vertical arms of the W818 and W818T model robots are stiff but lightweight ribreinforced aluminum profiles, driven via belt by a servo motor, thus reducing the moving mass.

W818T with Telescopic Vertical Axis

Incorporating the same basic design as the W818 with 3 servo driven main axes.

- Vertical axis with telescopic stroke for low overall height.
- Perfect for smaller molding machines in production halls with low ceiling heights.
- Extremely quiet operation for lowest noise.
- Very compact telescopic arm design for small mold opening height and fast removal times.

W818TS

The W818 and W818T model robots are available with a double-arm option having an additional servo driven vertical arm and gripper finger for the removal of sprues from 3-plate molds.

The Advanced Robot Series

All larger robots – starting from the W821 models – are designed with a moveable kick-stroke beam which is guided directly in the main carriage. The reduced moving mass allows high acceleration and deceleration for extremely short cycle times.

W821 – W831 The Compact Series

- **W821**
  The vertical arm consists of a rigid aluminum extrusion and guided by heavy-duty linear bearings and driven by a servomotor via belt to allow high speeds and short removal times.

- **W823**
  Telescopic Vertical Axis: The gripper is mounted in front of the telescopic arm allowing for a very short length, for minimum overall height and fast movements.

- **W828**

- **W831**
  The W831 use the same vertical arm design as is used for the W821 but with horizontal strokes up to 800 mm. Due to the high operating speeds of the vertical arm and payloads up to 12 kg, the W831 is one of our bestsellers for machines up to 500 tons.

**W822 – W832 The Middle Series**

- **W822**
  Rack and pinion drive for the vertical axis. The W822 can handle 15 kg of payload on strokes of either 1,000 mm or 1,200 mm and 12 kg when fitted with the 1,400 mm axis option.

- **W832**
  The vertical arm is a rigid aluminum extrusion with two high load linear bearings and a maximum length of 1,600 mm (63’). Designed for payloads up to 25 kg (44 lbs) and offering a high torque C-axis rotation for placing, the W832 is a popular robot for insert jobs.

- **W842**
  For greater payload and versatility around mid-sized molding machines of up to 800 tons of clamping force and higher.

**W833 – W843 The Middle Series with Telescopic Arm**

All larger robots beginning with the W833 models are equipped as standard with our patented telescopic vertical arm. The main vertical arm is driven via rack and pinion. The front arm is driven at double the speed via a belt.

- Minimum overall height of the robot.
- Double speed of the end-of-arm-tooling and short in/out times.
- Long vertical strokes for palletizing.

- **W833**
  Gripper and part weight up to 15 kg (33 lbs) with a maximum vertical stroke of 1,800 mm (71’). Therefore best suited for flexible automation on injection molding machines up to approximately 750 tons.

- **W843**
  The larger more substantial main beam and double walled kick stroke extrusion allow handling payloads up to 35 kg (77 lbs) and vertical strokes up to 2,600 mm (102’) for palletizing on pallets located on the shop floor.

**W853 – W873 The Large Series**

Intended for large molding machines and payloads of 50 kg (110 lbs) to 125 kg (275 lbs). The kick-stroke beam as well as the vertical telescopic arm, are constructed of thin walled steel tubes to allow fast movement with minimum vibration.

- **Options:**
  - Servo driven rotational axes for secondary requirements.
  - A variety of additional gripper and vacuum circuits for complex automation.

The ultra high speed robot series has been developed to achieve the fastest part removal times and allows mold open times of less than 1 second. In order to constantly achieve these short removal times over the long term, the vertical axis is activated directly over a planetary gear box engaging with a generously dimensioned tooth belt. This guarantees direct transfer of forces as well as minimizing the moving masses.

For mechanical absorption of the high acceleration and deceleration forces of up to 65 m/s², the vertical axis is designed with an extremely torsion stable kick stroke which is internally reinforced with ribs. The vertical axis consists of an aluminum profile which by means of finite element analysis, is designed for the lightest weight and highest stiffness.

**Advantages:**
- Highest productivity of the injection molding machine with the shortest cycle.
- Minimizes all moving masses for the highest acceleration and deceleration.

### Rotational Servo Axes A/B/C

For applications with additional degrees of freedom, WITTMANN supplies optional servo rotational axes around all 3 principle axes. Programming with increments of 0.01° ensures extremely fine adjustment.

- **Servo A-axis**
  - Allows the wrist flip to independently position the end-of-arm tooling and molded parts, i.e. in the mold area as well as during placement.

- **Servo B-axis**
  - Allows rotation of the end-of-arm tooling in the mold area between the fixed and flexible adapter plate and the arbitrary orientation of parts with a flip-down gripper during placement.

- **Servo C-axis**
  - Allows removal of molded parts from the moving as well as the fixed mold halves and the arbitrary presentation to downstream equipment.

**Advantages:**
- Compact mechanical design minimizes mold open.
- Highly dynamic servo motors and precise planetary gearboxes enable extremely fast movements.
WITTMANN offers a range of horizontal robots for the removal of thin wall parts with cycle times of less than 6 seconds.

**W8XH**

The horizontal side entry axis is driven by a SCARA type rotational movement. The gripper platen is synchronized for extremely fast, servo driven linear in/out movement of the gripper. This system provides very stable high speed operation with low vibration and requires minimum floor space next to the molding machine. The vertical axis and kick stroke are also servo-driven.

**W837**

The larger W837 model has been developed for fastest horizontal axis motion on molding machines up to 700 tons clamping force. This side entry robot can handle a payload of up to 50 kg for each horizontal axis.

(Robots with CNC8 control are named W8 robots.)

### Top Entry Robots for Stack Molds

Robots with two servo driven vertical arms for the automation of stack molds on medium molding machines up to approximately 400 tons clamping force. All robot models feature a fixed kick stroke beam. Both vertical arms are telescopic arms (like a W823 robot) with a payload of 3 to 20 kg.

### Special Applications

WITTMANN supplies the optimum robot for your specific application.

- Two robots can be mounted on one horizontal.
- Extra long horizontal axes.
- External control cabinet to connect amounts of peripheral inputs and outputs.
Technology based on “Radio Frequency Identification” (RFID) is used on WITTMANN robots to identify end-of-arm tooling and select the correct teach program for fail-proof operation. Another innovation by WITTMANN!

An RFID reader is mounted inside the plate of the wrist axis and detects without any contact a unique 64-bit identification number in a transponder fixed to the respective end-of-arm tooling. Based on the unique ID the control system automatically selects the right teach program.

— **Advantages:**
  - Eliminates errors by operators.
  - Avoids damage to molds and downstream equipment.

---

**Control of Downstream Equipment**

The universal WITTMANN R7.2 and R8 robot control systems provide multiple enhancements and interfaces for the integration of peripheral and downstream equipment. This increases the performance of the overall system and allows central access to all functions via the robot TeachBox.

**Examples of interfaces**

— Up to 8 independent signals for programmable conveyor indexing.
— Control of up to 32 vacuum and simultaneously 32 gripper circuits for the realisation of complicated end-of-arm tooling functions.
— Extensions of the control with decentralized I-/O modules on the robot and in the control cabinet.
— Connection of external decentralized I-/O modules via CAN-Bus.
— Mirroring of the TeachBox across Intranet/Internet via VNC.
— Email function.
— R8 CLI – Interface for connection with ERP system
Technology working for you.
